

konstrukcja

Promieniowy wentylator kanałowy z silnikiem znajdującym się w strumieniu przepływającego powietrza. Obudowa w najwyższej klasie szczelności L1 (wg. EN 1886), wykonana z galwanizowanej blachy stalowej ma kształt sześcianu składającego się z ramy i paneli bocznych, izolowanych (poza panelem wlotowym) warstwą wełny mineralnej o grubości 30mm. W wykonaniu standardowym wlot stanowi wyprofilowany pierścień bez króćca przyłączeniowego. Wylot uzyskuje się przez zdjęcie jednego z izolowanych paneli bocznych. Wylot można skonfigurować względem wlotu pod kątem 90° lub w linii prostej. Po stronie wylotu zastosować można panele USB wyposażone w okrągłe króćce przyłączeniowe lub paneleUSR z redukcją do przyłącza okrągłego. Po stronie wlotu istnieje możliwość montażu okrągłych króćców wlotowych ASB. W celu ograniczenia dodatkowych oporów, które powstaną przy stosowaniu powyższych paneli i króćców należy zwrócić szczególną uwagę na zachowanie odcinków prostych kanałów oraz króćców o jak największej średnicy przyłączeniowej.

wirnik

Wirnik nowej generacji wyważony dynamicznie w klasie G2.5, typu B - z łopatkami pochylonymi do tyłu, wykonany z blachy stalowej malowanej proszkowo.

napęd i sterowanie

Jednofazowy (230V, 50Hz, IP54, klasa izolacji F) lub trójfazowy (400V, 50Hz, IP55, klasa izolacji F) asynchroniczny silnik elektryczny zlokalizowany całkowicie poza strumieniem usuwanego powietrza.

Prędkość obrotowa modeli jednofazowych może być kontrolowana przy pomocy regulatorów transformatorowych. Zalecany zakres regulacji napięcia 110-230V. Silniki te posiadają czujniki temperatury uzwojeń typu termokontakt, które muszą być podłączone i monitorowane przez zewnętrzne urządzenie ochrony termicznej, np. automatykę, przekaźnik wbudowany w regulator, przekaźnik SET10 itp. Prędkość obrotowa modeli z silnikami trójfazowymi (3x230Δ/3x400Y) może być kontrolowana za pomocą przemienników częstotliwości, wyłącznie w zakresie częstotliwości (obrotów) podanych w tabeli/wykresie doboru. Zalecany czas przyspieszania i hamowania przetwornicą (rampa): 20-30 sek. W przypadku bezpośredniego podłączenia silników trójfazowych do sieci należy je zabezpieczyć przy pomocy wyłączników silnikowych z wbudowanym wyzwalaczem zwarciowym i przeciążeniowym. Nastawa wyzwalacza termicznego wyłącznika silnikowego musi być dostosowana do rzeczywistych parametrów pracy wentylatora i nie wyższa niż wartość I_{max} dla wentylatora.

maksymalna temperatura pracy

40 ÷ 60°C - w zależności od wybranego modelu.

zastosowanie

Transport czystego, niezapyłonego powietrza w instalacjach wentylacyjnych do i z pomieszczeń w obiektach: mieszkalnych, biurowych, przemysłowych i użyteczności publicznej. MBC zalecany jest szczególnie do montażu w instalacjach o ograniczonej przestrzeni jak również w instalacjach o nietypowej zabudowie.
